

A. Create website using .Core & Angular with following functionality

- 1) Create Customer Master which has Customer Id, Name, Email Id, Phone Number, Mobile Phone and Home Phone, Address fields and customer Name and Email Id are mandatory field.

Create view to list customer s Record.

Grid contains Customer Name, Email Id, And Contact Number filed.

Here Contact Number filed may be Phone Number, Mobile Phone and Home Phone.

Grid show Phone Number column if it is not null else show Mobile Number filed if it is not null else grid show home Phone in Contact Number field.

Perform Add Edit and delete operation on this record

Note: Grid Shows only Contact Number field.

- 2) Also perform validation on mandatory fields
- 3) Create Custom Validation for Email
- 4) To perform CRUD operation kindly don't use Entity Framework

Note: Create code using design pattern like DI, IOC etc.

B. SQL Query

There are three Employees, ItemMaster and OrderMaster. The relation between these tables is as below.

We want a report that shows Employee wise Item List.

Expected output

Employee Name	Items
A	Monitor, Mouse
B	Key Board, Processor
C	Monitor, Mouse
D	Processor

Note: Do not use Scaffolding feature of Visual studio to create View and CRUD method.
